

Claude Fable 5 experiment

One-line brief -> cited deck + Excel appendix

Testing autonomous research on India's two-wheeler spare parts aftermarket.

Input

**EV transition
impact on parts
demand through
2030**

5 min

landscape study

\$0.50-\$2

API spend

8-20 hrs

manual baseline

What the agent actually does

A thin local script orchestrates live research, analysis, charting, and file generation.

Brief

One-line prompt in any industry

Live sources

Search + fetch recent sources

Model + charts

Tables, sizing, assumptions

Deliverables

PowerPoint + Excel + metrics

Every data row names its source

The hard test was judgment

The EV brief had conflicting signals. The useful move was not copying the boldest forecast.

Official forecast

100%

EV penetration by FY27

Observed data

6.5%

EV share in FY26

Agent decision

Discount the weak forecast, build a fleet model through 2030, and write the assumptions out.

Cost discipline is the product

A small router call sends each brief to the cheapest model that can hold quality.

Router

Sonnet

Opus

Fable

\$0.50-\$2.00

API cost per deliverable

\$475

rough analyst-time baseline

Metrics file: model, routing rationale, tokens, cost, time

Open source. Reviewers wanted.

The benchmark is still provisional. I need two or three blind reviews from people who know research, consulting, or distribution.
